CONTENUTO DELLE TABELLE

I dati sono trasmessi da Osservatori o stazioni termopluviometriche controllati o dipendenti direttamente dall'Ufficio.

Ogni stazione è fornita di un termometro a massima e a minima, che viene osservato ogni giorno alle ore 9 antimeridiane.

Le letture eseguite ai termometri vengono assegnate al giorno stesso dell'osservazione.

Le stazioni sono ordinate nelle tabelle secondo la rispettiva posizione idrografica.

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni termometriche che hanno funzionato nell'anno.

TABELLA I. — Sono riportati, per la maggior parte delle stazioni, i valori manimi e minimi rilevati giornalmente, le rispettive medie mensili, la temperatura media del mese e le corrispondenti medie del periodo.

TABELLA II. — Per tutte le stazioni della tabella I sono ziportate:

- a) le medie mensili ed annue delle massime e delle minime temperature osservate giornalmente e le medie mensili ed annue delle temperature diurne. Come « temperatura diurna » è assunto il valore della semisomma delle temperature massima e minima osservate in uno stesso giorno;
- b) le temperature estreme (massima e minima) osservate in ogni mese e nell'anno, ed il giorno nel quale sono state osservate.

Tutte le temperature riportate sono espresse in gradi centigradi e corrispondono alle letture effettivamente eseguite, non essendosi effettuata la ridurione al livello del mare.

TERMINOLOGIA

- Alterna di precipitazione (mm): quosicate del volume di acqua raccolta nel pluviometro (compresa, eventualmente, la neve sciolta) per l'area della superficio orizzontale dell'imbuto raccoglitore.
- 2. Giorno piovoso: giorno in cui è stata misurata un'alterza di precipitazione uguale o superiore ad un millimetro.

CONTENUTO DELLE TABELLE

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni di osservazione che hanno funzionato nell'anno.

I valori delle precipitazioni riportati sono espressi in milimetri di acqua e comprendono proggia e neve fusa.

TABELLA I. — Per ogni stanione riporta la quantità di pioggia caduta giornalmente ed i totali menali ed annuo della precipitazione e del aumero dei giorni piovosi.

Per le stazioni dotate di apparecchiatura a lettura diretta (pluviometri) le osservazioni vengono eseguite ogni giorno allo ore 9 ed il risultato viene attribuito al giorno etesso della misura: il valore segnoto rappresenta quindi la quantità di precipitazione caduta nello 24 ore che hanno preceduto la misura.

Per le stasioni dotate di pluviografo si riporta, per ogni giorno, la quantità di pioggia che dal diagramma risulta caduta nelle 24 ore comprese fra la ore 9 del giorno precedente e le ore 9 del giorno di cui si tratta.

Con carattere grassetto è stampato il massimo quantitativo giornaliero misurato per ogni mese.

TABELLA II. — Per le etesse etazioni di cui alla tabella II, riporta i totali menalli ed annui delle quantità di precipitezione.

Per ciascuna stazione è riporteto in grassetto il più elevato dei valori mensili ad in corsivo il più basso.

TABELLA III. — Per le stazioni dotate di pluviografo, riporta i dati relativi ai valori più elevati delle precipitazioni registrate, nell'anno, per 1, 3, 6, 12 e 24 ore consecutive appartenenti o non allo stesso giorno.

Sono considerate la precipitazioni iniziate dopo le ere 0 del primo gennaio e quelle, eventualmente terminate dopo le ore 24 del 31 dicembre.

TABELLA IV. — Riporta i massimi valori delle precipitazioni verificatesi per L. 2, 3, 4 e 5 giorni consecutivi, appartenenti o nu allo stesso meso. Sono considerati solamenti i periodi il cui inizio cade entro l'anno anche se eventualmente sono terminati nell'anno successivo.

TABELLA V. — Riporta il valore, la durata e la data delle precipitazioni di maggiore intensità e di breve durata registrate dai pluviografi.

TABELLA VI. — Riporta per i mesi da gennaio a maggio e da ottobre a dicembre sei quali possono verificarsi precipitazioni nevoso:

- a) le altezze in centimetri degli strati nevosi sul suolo presenti nell'ultimo giorno delle tre decadi mensili;
- b) il numero dei giorni nei quali si sono avute precipitazioni nevoso;
- e) il numero complessivo dei giorni di permanenza della peve sul suolo.

METEOROLOGIA

Nel presente Capitolo sono riportati per i principali Osservatori Meteorologici del Compartimento i valori della pressione atmosferica, dell'umidità relativa, della nebulogità o del vento. I valori della temperatura e delle precipitazioni sono stati riportati nelle rispettive Sezioni A e B.

Gli Osservatori di cui si pubblicano i dati sono quelli di Trieste, Udine, Bellund, Treviso, San Nicolo' di Lido (Venezia), Chioccia, Padova, Colle Venda, Vicenza, Bolzano, Trento, Rovico e Sadocca (Idrovors).

CONTENUTO DELLE TABELLE

TABELLA I. — Riporta i valori medi giornalieri, mensili ed annui della PRES-SIONE ATMOSFERICA espressa in mm di mercurio, a zero gradi e non ridotta al mare.

TABELLA II. — Riporte i valori medi giornalieri, menuli ed annui della UMI-DITA' RELATIVA. Il valore dell'umidità relativa (espresso in centesims) è quello del rapporto fra la tensione del vapor acqueo misurato e la tensione massima corrispondente alla temperatura rilevata durante l'osservazione.

TABELLA III. — Riporta i valori medi giornalieri, mensili ed annui della NESU-LOSITA' espressa in decimi di ciolo coporto. TABELLA IV. — Riporta i valori medi giornalieri, mensili ed annui della VE-LOCITA' DEL VENTO espressi in km/ora e contiene, inoltre, la direzione del vento prevalente durante il giorno e la durata in ore durante il quale esso ha soffato, nonché la velocità media oraria mussima e la sua direzione.

I valori medi giornalieri della pressione e dell'umidità sono calcolati in base a valori biorari; quelli della velocità del vento in base a valori orari, mentre quelli della mebulocità corrispondono alla media aritmetica delle osservazioni alle ore 7, 14 e 19.

Per tutti gli elementi meteorologici riportati in questo capitolo, viene adottato il giorno civile, dalle ore 0 alle 24.
